Firebase Hosting

(firebase.google.com/docs/hosting)

A personal favorite of mine! Pretty easy to setup with its CLI.

The screenshot shows the Firebase Hosting website. The header includes the Firebase logo, navigation links for Products, Use Cases, Pricing, and Docs, a search bar, a language selector set to English, and a 'Go to console' button with a user profile icon. The main content area has a blue background with the text 'Firebase helps you build and run successful apps'. Below this, it says 'Backed by Google and loved by app development teams - from startups to global enterprises'. There are three buttons: 'Get started', 'Try demo', and 'Watch video'. An illustration of two people working on a laptop with a rocket launch graphic is on the right. A white box at the bottom contains the text 'Products and solutions you can rely on through your app's journey'.

GitHub Pages (pages.github.com)

Keeping your projects together AND hosting them? A Win-Win.

What is GitHub Pages?

Muj
@mujs.dev

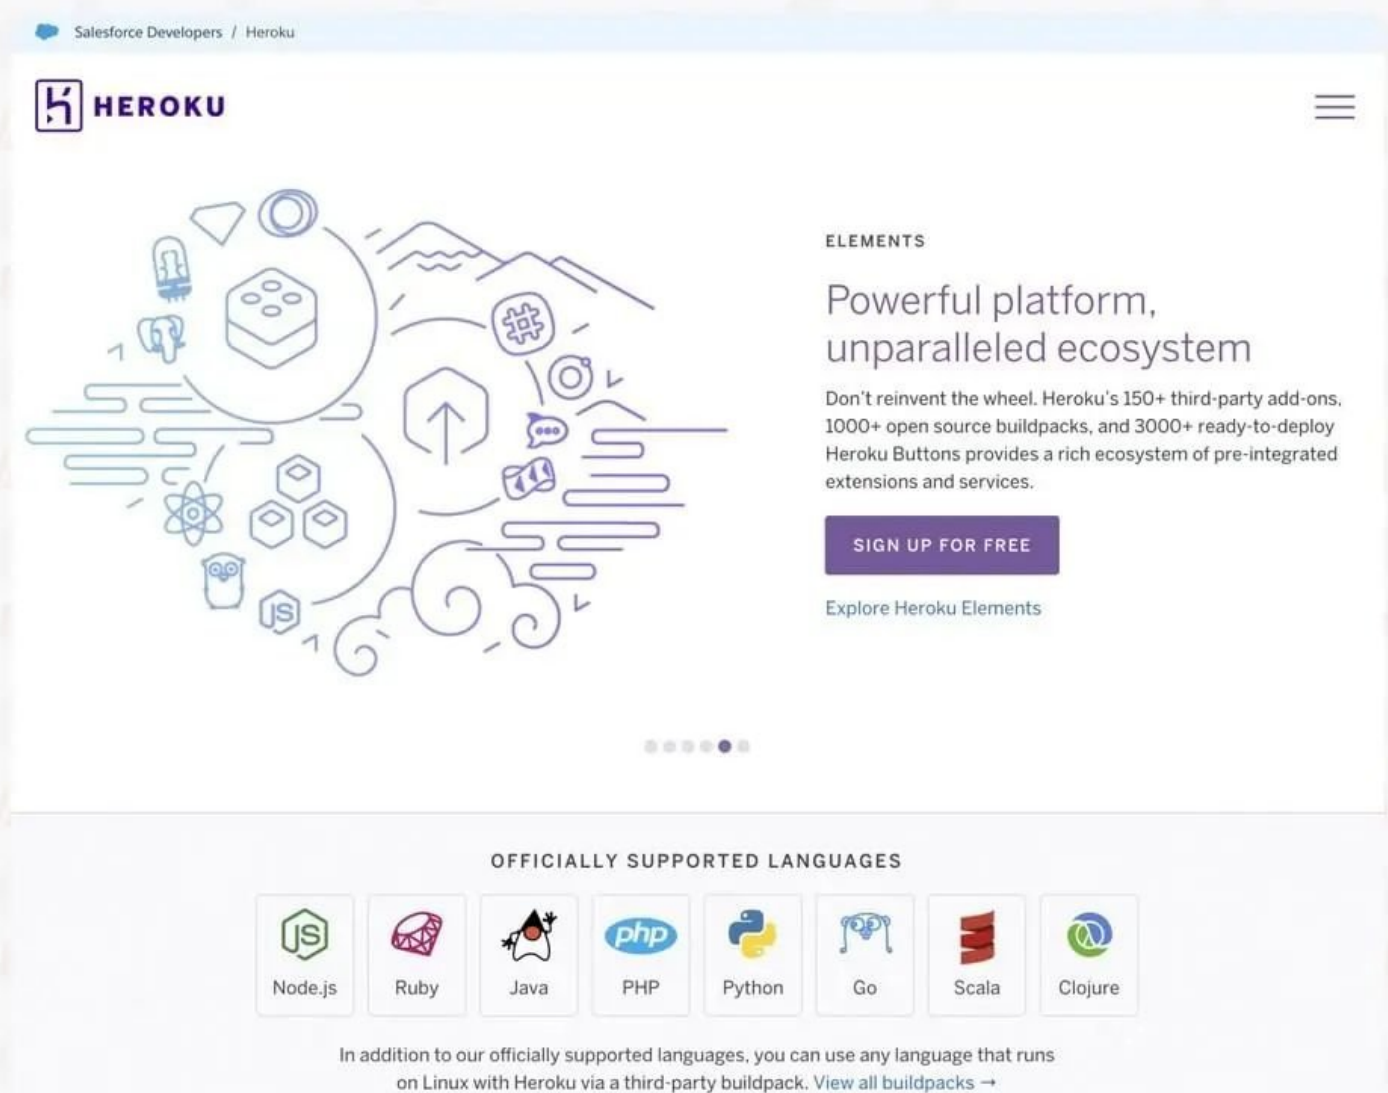

Pretty powerful

©2021

Heroku (heroku.com)

The free version is pretty slow but it's worth hosting backend related stuff.

Netlify (netlify.com)

Netlify is a pretty powerful hosting service. Well known for its JAMStack Architecture. They do great with team workflow too!

New! Collaborative Deploy Previews to get better, more frequent feedback from your team. [Learn more](#)

Vercel (vercel.com)

Vercel is starting to become my favorite. Provides analytics (free to some extent). Nextjs works really well with Vercel too!
